EXPERIENCE

BUILT THESE THINGS

Senior Software Engineer @ Flagler Health

April 2025 — Current

- Built and tuned AI systems across traditional predictive models and LLM-based agents, using LLMs as part of the model-tuning loop while maintaining distinct training, evaluation, context, and state-management workflows.
- Developed and deployed reusable AI skills and workflows for engineering and operations, giving agents structured context and state management to operate against real application state rather than isolated prompts.
- Made AI-assisted implementation verifiable by encoding human-reviewed reasoning into repeatable checks, then applying adversarial review and production-data validation to catch failures conventional tests missed.
- Helped shape the voice-agent layer, connecting patient context, scheduling, clinical workflows, and operational actions to bring conversational AI directly into care delivery.
- Normalized messy healthcare data at the source, reconciling inconsistent clinic records across EHR/EMR systems, claims, payers, and providers into inputs that users, automation, and AI can reason over.
- Turned fragmented clinic operations into structured, queryable primitives, establishing an extensible data model and workflow rails that support new use cases without requiring another bespoke integration.
- Developed our task and action management system as an agent-compatible execution layer, with broad event ingest, dynamic entity references, workflow logic, and downstream actions.
- Modeled payer coverage at the plan, clinic, capability, and procedure level, translating ambiguous SOPs into deterministic, auditable medical-necessity and coverage logic that humans and AI can reuse.
- Connected enrollment, provider activity, EHR events, and work performed to billing and time tracking, giving operational analytics a more reliable account of what happened across the business.
- Established engineering guardrails for AI-native development, helping engineers adopt AI without shifting the entire bottleneck to code review and validation.
- Shaped foundational platform capabilities around determinism: making state explicit, reasoning inspectable, and behavior reproducible by both humans and AI.

Senior Software Engineer @ Ria Health

August 2021 — April 2025

- Directed a nationwide telehealth platform with intelligent scheduling and care coordination, managing state, license, credential, insurance-network, and phase-of-care constraints across a distributed provider network.
- Applied AI-driven demand and utilization forecasting across millions of clinical and operational data points to coordinate provider capacity and reduce patient wait times, including multi-provider care within a single session.
- Built patient-driven clinical assessment and digital therapeutics infrastructure, capturing longitudinal quantitative and qualitative data and integrating Bluetooth healthcare devices through SDKs and xAPI.
- Standardized device, engagement, assessment, and clinical data to power operational analytics, research, and real-time guidance for clinicians and patients under regulated data-handling requirements.
- Implemented automated clinical studies to capture patient feedback and outcomes, producing peer-reviewed research and feeding findings back into clinical and operational decisions.

Software Engineer @ Integral Ad Science

July 2019 — August 2021

- Built production software for a high-scale advertising platform after transitioning from QA engineering into software development.
- Developed automated testing and reliability tooling across distributed systems, working closely with engineering teams to identify and resolve production issues.

Computer Science and Math Educator @ Leap Education

October 2015 — May 2019

- Taught computer science and mathematics while developing technical curriculum and supporting students across a wide range of experience levels.

EDUCATION

LEARNT THESE THINGS

Bachelors in Computer Science @ New York University — Minors in Web Development and Chemistry — September 2015 — May 2019
